| الرقم: | المدة: ساعة ونصف |

## This exam is formed of three obligatory exercises in three pages. <br> The use of non-programmable calculator is recommended.

## Exercise 1 ( 7 pts)

## Motion of a block on an inclined plane

A block (M), considered as a particle of mass $m=0.5 \mathrm{~kg}$, can move on a straight track AF, situated in a vertical plane and inclined by an angle $\alpha=30^{\circ}$ with the horizontal. Point A is taken as an origin of the x -axis confounded with (AF). A massless spring of natural length $\ell_{0}=50 \mathrm{~cm}$ and force constant k is placed on the inclined track; one of its ends is fixed at F , and the other end is free at O (Doc. 1).
$(\mathrm{M})$ is released without initial velocity from the top A of the track AF, and then it passes through point B with a velocity $\vec{V}_{B}$ of magnitude $V_{B}=\sqrt{2} \mathrm{~m} / \mathrm{s}$ and through point C with a velocity $\overrightarrow{\mathrm{V}}_{\mathrm{C}}$ of magnitude $\mathrm{V}_{\mathrm{C}}=\sqrt{2.4} \mathrm{~m} / \mathrm{s}$. After point $\mathrm{C},(\mathrm{M})$ continues its motion without friction, hits the spring, and compresses it by a distance OO'.
The aim of this exercise is to determine k .
Take:

- the horizontal plane containing ( FH ) as a reference level for the gravitational potential energy;
- $\mathrm{AB}=\mathrm{BC}=20 \mathrm{~cm}, \mathrm{AF}=1.6 \mathrm{~m}$;
- $\mathrm{g}=10 \mathrm{~m} / \mathrm{s}^{2}$.

1) Calculate the mechanical energy of the system [(M), Earth] at A, B and C.
2) Deduce that:
2.1) the motion of $(M)$ between $A$ and $B$ takes place without friction;
2.2) (M) is submitted to a force of friction $\vec{f}$ during its motion between $B$ and $C$.
3) Show that the internal energy of the system [(M), Earth, Track, Atmosphere] increases by 0.4 J during the motion of $(\mathrm{M})$ between B and C .
4) Determine the magnitude $f$ of the force of friction $\vec{f}$, supposed constant and parallel to the displacement, exerted on (M) during its motion between B and C .
5) The mechanical energy of the system [(M), Earth] at O is $\mathrm{ME}_{\mathrm{O}}=3.6 \mathrm{~J}$. Why?
6) (M) reaches $O$, and compresses the spring by a maximum distance $O^{\prime}=24 \mathrm{~cm}$. Determine the value of k .

## Exercise 2 ( 6 pts)

## Launching of two pucks

An experimental device is made up of:

- two pucks (A) and (B), of respective masses $\mathrm{m}_{\mathrm{A}}$ and $\mathrm{m}_{\mathrm{B}}$, able to move without friction on a horizontal rail;
- a spring (R) of negligible mass and of stiffness $k=100 \mathrm{~N} / \mathrm{m}$.
$(\mathrm{R})$ is compressed between (A) and (B) by means of a light string to form a system at rest (Doc. 2).

We burn the string, (A) and (B) are then ejected. Just after ejection, (A) and (B) move on the horizontal rail and their centers of mass move along the horizontal $x$-axis of unit vector $\vec{i}$ with the velocities $\overrightarrow{\mathrm{v}}_{\mathrm{A}}$ and $\overrightarrow{\mathrm{v}}_{\mathrm{B}}$ respectively (Doc. 3).
The aim of this exercise is to study the effect of the mass of a puck on its speed after ejection.
Take the horizontal plane containing the x -axis as a reference level for gravitational potential energy.

1) Before burning the string, the system [(A), (B), (R)] possesses a certain form of energy «E».
1.1) In what form is this energy stored?
1.2) Calculate the value of « $\mathrm{E} »$ knowing that the spring is compressed by 4 cm .
2) After ejection, the linear momentum of the system $[(A),(B)]$ is conserved. Justify.
3) Deduce that (A) and (B) are ejected in opposite directions.
4) The used experimental device permits to measure the speed $v_{A}$ of (A) after ejection. Two experiments are carried out with this device.
4.1) Experiment 1: The two pucks have the same mass $m_{A}=m_{B}=500 \mathrm{~g}$. Just after ejection, (A) moves with a velocity $\overrightarrow{\mathrm{v}}_{\mathrm{A}}=-0.4 \overrightarrow{\mathrm{i}} \quad\left(\mathrm{v}_{\mathrm{A}}\right.$ in $\left.\mathrm{m} / \mathrm{s}\right)$.

### 4.1.1) Determine $\vec{v}_{B}$.

4.1.2) Deduce the value of the kinetic energy KE of the system [(A), (B)] just after ejection.
4.1.3) Compare the obtained values of KE and $« \mathrm{E} »$. Conclude.
4.2) Experiment 2: We repeat experiment 1 by adding an object of mass $m=100 \mathrm{~g}$ to puck (B), the mass of (A) remains the same (Doc. 4). Just after ejection, (A) moves with a velocity $\overrightarrow{\mathrm{v}}_{\mathrm{A}}=-0.42 \overrightarrow{\mathrm{i}}\left(\mathrm{v}_{\mathrm{A}}\right.$ in $\left.\mathrm{m} / \mathrm{s}\right)$.

Determine $\vec{v}_{B}$.
5) Deduce the effect of the increase in mass of a puck on its speed after ejection.

## Exercise 3 (7 pts)

## Time constant of RC series circuit

The aim of this exercise is to determine the time constant $\tau$ of RC series circuit during charging and discharging of a capacitor and the capacitance of a capacitor. For this purpose, we set up the circuit of document 5 that includes:

- a capacitor, initially uncharged, of capacitance $C$;
- a resistor of resistance $\mathrm{R}=100 \mathrm{k} \Omega$;
- an ideal battery of constant voltage $\mathrm{U}_{\mathrm{PN}}=\mathrm{E}=12 \mathrm{~V}$;
- a voltmeter (V) connected in parallel across the terminals of the capacitor;
- a double switch K.

1) Charging the capacitor

At the instant $\mathrm{t}_{0}=0, \mathrm{~K}$ is placed in position (1) and the charging process of the capacitor starts.

1.1) Show that the differential equation that describes the variation of the voltage $u_{B F}=u_{C}$ across the capacitor is: $R C \frac{d u_{C}}{d t}+u_{C}=E$.
1.2) The solution of this differential equation has the form: $u_{C}=E-E e^{\frac{-t}{\tau}}$ where $\tau$ is constant. Determine the expression of $\tau$ in terms of R and C .
1.3) At $\mathrm{t}_{1}=7 \mathrm{~s}$, the voltage across the terminals of the capacitor equals $\frac{\mathrm{E}}{2}$. Determine the value of $\tau$.
1.4) Deduce the value of $C$.
2) Discharging the capacitor

The capacitor is completely charged.
At an instant $t_{0}=0$, taken as an initial time, the switch $K$ is turned to position (2); the phenomenon of discharging of the capacitor thus starts.
The variation of $u_{C}$ during this case is given by: $u_{C}=E e^{\frac{-t}{\tau}}$.
2.1) Show that: $\ln \left(\frac{E}{u_{C}}\right)=\frac{1}{\tau} \times t$.
2.2) The table below, gives different values of $u_{B F}=u_{C}$ measured by the voltmeter $(V)$ at different instants of time $t$.

| $\mathrm{t}(\mathrm{s})$ | 0 | 5 | 10 | 20 | 30 | 40 | 50 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{u}_{\mathrm{C}}(\mathrm{V})$ | 12 | 7.3 | 4.4 | 1.6 | 0.6 | 0.2 | 0.08 |
| $\ln \left(\frac{\mathrm{E}}{\mathrm{u}_{\mathrm{C}}}\right)$ |  |  |  |  |  |  |  |

2.2.1) Copy and complete the table.
2.2.2) Trace, on a graph paper, the curve that represents $\ln \left(\frac{E}{u_{C}}\right)$ as a function of time.

Take the scale:

- on the abscissa axis $1 \mathrm{~cm} \leftrightarrow 5 \mathrm{~s}$;
- on the ordinate axis $1 \mathrm{~cm} \leftrightarrow 1$.
2.2.3) Referring to the obtained curve, show that: $\ln \left(\frac{E}{u_{C}}\right)=0.1 \times t \quad$ (S.I).
2.3) Deduce the values of the time constant $\tau$ of the circuit and the capacitance $C$ of the capacitor.

|  | Exercise 1 (7 pts) Motion of a block on an inclined plane |  |
| :---: | :---: | :---: |
| Part | Answer | Note |
| 1 | $\begin{aligned} & \mathrm{h}_{\mathrm{A}}=\mathrm{AF} \sin 30^{\circ}=1.6 \times 0.5=0.8 \mathrm{~m} \\ & \mathrm{ME}_{\mathrm{A}}=\mathrm{mgh}_{\mathrm{A}}+0=0.5 \times 10 \times 0.8=4 \mathrm{~J} \\ & \mathrm{ME}_{\mathrm{B}}=\mathrm{mgh}_{\mathrm{B}}+\frac{1}{2} \mathrm{~m} \mathrm{~V}_{\mathrm{B}}^{2}=0.5 \times 10 \times 1.4 \times \sin 30^{\circ}+\frac{1}{2} \times 0.5 \times(\sqrt{2})^{2}=4 \mathrm{~J} \\ & \mathrm{ME}_{\mathrm{C}}=\mathrm{mgh}+\frac{1}{2} \mathrm{~m} \mathrm{~V}_{\mathrm{C}}^{2}=0.5 \times 10 \times 1.2 \times \sin 30^{\circ}+\frac{1}{2} \times 0.5 \times(\sqrt{2.4})^{2}=3.6 \mathrm{~J} \end{aligned}$ | $\begin{gathered} \hline 0.5 \\ 0.5 \\ 1 \\ 0.5 \\ \hline \end{gathered}$ |
| 2.1 | Since $\mathrm{ME}_{\mathrm{A}}=\mathrm{ME}_{\mathrm{B}}=4 \mathrm{~J}$ | 0.25 |
| 2.2 | Since $\mathrm{ME}_{\mathrm{C}}<\mathrm{ME}_{\mathrm{B}}$; so, ME decreases thus friction exists between B and C | 0.25 |
| 3 | The system [(M), Earth, Track, Atmosphere] is energy isolated. So its total energy E is conserved, $\mathrm{E}=\mathrm{ME}+\mathrm{U}=$ constant So, $\Delta \mathrm{U}=-\Delta(\mathrm{ME})=-(3.6-4)=0.4 \mathrm{~J}$ $\Delta \mathrm{U}>0$ so it's internal energy increases by 0.4 J . | 1 |
| 4 | The variation in mechanical energy equals the work of friction: $\Delta \mathrm{ME}=\mathrm{W}_{\overrightarrow{\mathrm{f}}}$ so $\Delta(\mathrm{ME})=-0.4=-\mathrm{f} \times \mathrm{BC}=-\mathrm{f} \times 0.2 . \mathrm{So}, \mathrm{f}=2 \mathrm{~N}$ | 1 |
| 5 | Since $\mathrm{ME}_{\mathrm{O}}=\mathrm{ME}_{\mathrm{C}}=3.6 \mathrm{~J}$ | 0.25 |
| 6 | $\mathrm{ME}_{\mathrm{O}}=\mathrm{ME}_{\mathrm{O}^{\prime}}=\mathrm{KE}_{\mathrm{O}^{\prime}}+\mathrm{PE}_{\mathrm{g}\left(\mathrm{O}^{\prime}\right)}+\mathrm{PE}_{\mathrm{el}\left(\mathrm{O}^{\prime}\right)}=0+\mathrm{mgh}_{\mathrm{O}^{\prime}}+\frac{1}{2} \mathrm{kx}^{2}$ <br> But $\mathrm{x}=0.24 \mathrm{~m}$ and $\mathrm{v}=0$, (maximum compression) <br> $\sin 30^{\circ}=\frac{\mathrm{h}_{\mathrm{O}^{\prime}}}{\mathrm{FO}^{\prime}}$ with $\mathrm{FO}^{\prime}=\mathrm{FO}-\mathrm{OO}^{\prime}=50-24=26 \mathrm{~cm}=0.26 \mathrm{~m}$ <br> So ho' $=0.26 \times \sin 30^{\circ}=0.13 \mathrm{~m}$, <br> Thus, $3.6=0.5 \times 10 \times 0.13+\frac{1}{2} \times \mathrm{k} \times 0.24^{2}$ <br> Hence, $\mathrm{k}=102.43 \mathrm{~N} / \mathrm{m}$ | 1.75 |

| Exercise 2 (6 pts) | 2 (6 pts) Launching of two pucks |  |
| :---: | :---: | :---: |
| Part | Answer | Note |
| 1.1 | In the form of elastic potential energy in the spring. | 0.5 |
| 1.2 | $\mathrm{E}=\frac{1}{2} \mathrm{kx}{ }^{2}=\frac{1}{2} \times 100 \times(0.04)^{2}=0.08 \mathrm{~J}$ | 0.75 |
| 2 | The external forces on the system [(A), (B)] are: <br> Weight $\overrightarrow{\mathrm{W}}_{\mathrm{A}}$ and the normal reaction $\overrightarrow{\mathrm{N}}_{\mathrm{A}}: \overrightarrow{\mathrm{W}}_{\mathrm{A}}+\overrightarrow{\mathrm{N}}_{\mathrm{A}}=\overrightarrow{0}$ <br> Weight $\overrightarrow{\mathrm{W}}_{\mathrm{B}}$ and the normal reaction $\overrightarrow{\mathrm{N}}_{\mathrm{B}}: \overrightarrow{\mathrm{W}}_{\mathrm{B}}+\overrightarrow{\mathrm{N}}_{\mathrm{B}}=\overrightarrow{0}$ <br> So, the sum of external forces acting on the system [(A), (B)] is nil. <br> By Newton's second law, $\sum \overrightarrow{\mathrm{F}_{\mathrm{ext}}}=\frac{\mathrm{d} \overrightarrow{\mathrm{P}}}{\mathrm{dt}}$, <br> Thus, linear momentum of the system [(A), (B)] is conserved. | 0.75 |
| 3 | $\overrightarrow{\mathrm{P}}_{\text {before }}=\overrightarrow{\mathrm{P}}_{\text {ater }} \text { so } \overrightarrow{0}=\mathrm{m}_{\mathrm{A}} \overrightarrow{\mathrm{v}}_{\mathrm{A}}+\mathrm{m}_{\mathrm{B}} \overrightarrow{\mathrm{~V}}_{\mathrm{B}} \text { thus } \overrightarrow{\mathrm{v}}_{\mathrm{A}}=-\frac{\mathrm{m}_{\mathrm{B}}}{\mathrm{~m}_{\mathrm{A}}} \overrightarrow{\mathrm{v}}_{\mathrm{B}}$ <br> Thus, $\overrightarrow{\mathrm{v}}_{\mathrm{A}}$ has a direction opposite to $\overrightarrow{\mathrm{v}}_{\mathrm{B}}$. | 1 |
| 4.1.1 | $\overrightarrow{\mathrm{v}}_{\mathrm{B}}=-\frac{\mathrm{m}_{\mathrm{A}}}{\mathrm{~m}_{\mathrm{B}}} \overrightarrow{\mathrm{v}}_{\mathrm{A}} \text {, so } \overrightarrow{\mathrm{v}}_{\mathrm{B}}=+0.4 \overrightarrow{\mathrm{i}}\left(\mathrm{v}_{\mathrm{B}} \text { in } \mathrm{m} / \mathrm{s}\right)$ | 0.25 |
| 4.1.2 | $\mathrm{KE}=\frac{1}{2} \mathrm{~m}_{\mathrm{A}} \mathrm{v}_{\mathrm{A}}^{2}+\frac{1}{2} \mathrm{~m}_{\mathrm{B}} \mathrm{v}_{\mathrm{B}}^{2}=\frac{1}{2} \times 0.5 \times 0.16+\frac{1}{2} \times 0.5 \times 0.16=0.08 \mathrm{~J}$ | 1 |
| 4.1.3 | $\mathrm{KE}=\mathrm{E}=0.08 \mathrm{~J}$ <br> Conclusion : All stored elastic potential energy is converted into kinetic energy. | $\begin{aligned} & 0.5 \\ & 0.5 \end{aligned}$ |
| 4.2 | $\overrightarrow{\mathrm{v}}_{\mathrm{B}}=-\frac{\mathrm{m}_{\mathrm{A}}}{\mathrm{~m}_{\mathrm{B}}} \overrightarrow{\mathrm{v}}_{\mathrm{A}} \text {, so } \overrightarrow{\mathrm{v}}_{\mathrm{B}}=-\frac{0.5}{0.6} \times(-0.42 \overrightarrow{\mathrm{i}})=0.35 \overrightarrow{\mathrm{i}} \mathrm{~m} / \mathrm{s}$ | 0.25 |
| 5 | As the mass of the puck increases, its speed decreases. | 0.5 |

|  |  | Exercise 3 ( 7 pts) Time constant of RC series circuit |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Part | Answer |  |  |  |  |  |  | Note |
| 1.1 | Law of addition of voltages: $u_{\text {PN }}=u_{\text {PA }}+u_{\text {AB }}+u_{\text {BF }}+u_{\text {PN }}$ $E=R i+u_{C}$, but $i=\frac{d q}{d t}$ and $q=C u_{C}, \quad$ so $i=C \frac{d u_{C}}{d t}$ Then: $E=R C \frac{d u_{C}}{d t}+u_{C}$ |  |  |  |  |  |  | 1 |
| 1.2 | $u_{C}=E-E e^{\frac{-t}{\tau}} \text { so } \frac{d u_{C}}{d t}=\frac{E}{\tau} e^{\frac{-t}{\tau}}$ <br> Replace $u_{C}$ and $\frac{\mathrm{du}_{\mathrm{C}}}{\mathrm{dt}}$ in the differential equation: <br> $\operatorname{RC}\left[\frac{\mathrm{E}}{\tau} \mathrm{e}^{\frac{-\mathrm{t}}{\tau}}\right]+\mathrm{E}-\mathrm{E} \mathrm{e}^{\frac{-t}{\tau}}=\mathrm{E}$ then: $\mathrm{E} \mathrm{e}^{\frac{-\mathrm{t}}{\tau}}\left[\frac{\mathrm{RC}}{\tau}-1\right]+\mathrm{E}=\mathrm{E}$ <br> So $E \mathrm{e}^{\frac{-\mathrm{t}}{\tau}}\left[\frac{\mathrm{RC}}{\tau}-1\right]=0 \quad$ but $\mathrm{E}^{\frac{-\mathrm{t}}{\tau}} \neq 0$ thus $\frac{\mathrm{RC}}{\tau}-1=0$; therefore, $\tau=\mathrm{RC}$ |  |  |  |  |  |  | 0.75 |
| 1.3 | $u_{C}=E-E e^{\frac{-t}{\tau}}$ so $\frac{E}{2}=E-E e^{\frac{-t_{1}}{\tau}}$, we get $E e^{\frac{-t_{1}}{\tau}}=\frac{E}{2}$ Then, $\mathrm{e}^{\frac{-\mathrm{t}_{1}}{\tau}}=\frac{1}{2}$; so $\frac{-\mathrm{t}_{1}}{\tau}=-\ln 2$, then $\tau=\frac{\mathrm{t}_{1}}{\ln 2}=\frac{7}{0.693}=10.10 \mathrm{~s} \approx 10 \mathrm{~s}$ |  |  |  |  |  |  | 0.75 |
| 1.4 | $\tau=\mathrm{R} \mathrm{C}$, so $10.10=10^{5}$, then $\mathrm{C} \approx 10^{-4} \mathrm{~F}$ |  |  |  |  |  |  | 0.5 |
| 2.1 | $u_{C}=E e^{\frac{-t}{\tau}}$ so $\frac{E}{u_{C}}=\frac{1}{e^{\frac{-t}{\tau}}}=e^{\frac{t}{\tau}}$. Then, $\ln \frac{E}{u_{C}}=\ln e^{\frac{t}{\tau}}$. So, $\ln \frac{E}{u_{C}}=\frac{t}{\tau}$ Hence, $\ln \frac{E}{u_{c}}=\frac{1}{\tau} \times t$ |  |  |  |  |  |  | 0.5 |
| 2.2.1 | $\ln \frac{\mathrm{E}}{\mathrm{u}_{\mathrm{c}}}$ | 0 0.5 | 1 | 2 | 3 | 4.1 | 5 | 1 |
| 2.2.2 |  |  |  |  |  |  |  | 1 |
| 2.2.3 | The graph is a straight line passing through the origin whose equation is: $\ln \frac{\mathrm{E}}{\mathrm{u}_{\mathrm{C}}}=$ slope $\times \mathrm{t} ;$ slope $=(5-0) /(50-0)=0.1 \quad$ Thus, $\ln \frac{\mathrm{E}}{\mathrm{u}_{\mathrm{C}}}=0.1 \times \mathrm{t}$ |  |  |  |  |  |  | 0.5 |
| 2.3 | Slope $=0.1=\frac{1}{\tau}$ which gives $\tau=10 \mathrm{~s}$ <br> But, $\tau=\mathrm{RC}$; thus, $\mathrm{C}=\tau / \mathrm{R}=10 / 10^{5}=10^{-4} \mathrm{~F}$ |  |  |  |  |  |  | $\begin{aligned} & 0.5 \\ & 0.5 \end{aligned}$ |
